

Aim: Inheritance / Access modifiers Example Using typescript

Program:

```
class BankAccount {  
    public accountHolder : string;  
    private balance : number;  
    protected accountNumber: number;  
  
    constructor(accountHolder: string, balance: number, accountNumber:  
number) {  
        this.accountHolder = accountHolder;  
        this.balance = balance;  
        this.accountNumber = accountNumber;  
    }  
  
    public showAccountDetails(): void {  
        console.log("Account Holder:", this.accountHolder);  
        console.log("Balance:", this.balance);  
        console.log("Account Number:", this.accountNumber);  
    }  
}  
  
class SavingsAccount extends BankAccount {  
  
    constructor(accountHolder: string, balance: number, accountNumber:  
number) {  
        super(accountHolder, balance, accountNumber);  
    }  
  
    public showSavingsDetails(): void {
```

```
        console.log("\nSavings Account Details:");
        console.log("Account Holder:", this.accountHolder);
        console.log("Account Number:", this.accountNumber);
    }
}

let customer = new SavingsAccount("Rahul", 50000,123456789);

customer.showAccountDetails();
customer.showSavingsDetails();

console.log("\nAccessing Public Member: ");
console.log(customer.accountHolder);
```

Output:

```
Account Holder: Rahul
Balance: 50000
Account Number: 123456789
```

```
Savings Account Details:
Account Holder: Rahul
Account Number: 123456789
```

```
Accessing Public Member:
Rahul
```

```
=== Code Execution Successful ===
